Factoring Brief Review

Differences of Square

$$x^2 - 4 = (x + 2)(x - 2)$$

Polynomial

$$\begin{aligned} 2x^2 + 3x - 2 \\ \longrightarrow (2x^2 + 4x)(-x - 2) \\ \longrightarrow 2x(x + 2) - 1(x + 2) \\ \longrightarrow (2x - 1)(x + 2) \end{aligned}$$

Radical Fractions

- Multiply everything by monomial denominator

$$\frac{2}{\sqrt{2x}} \longrightarrow \frac{2\sqrt{2x}}{2x} \longrightarrow \frac{\sqrt{2x}}{x}$$

- Multiply everything by conjugate for polynomial denominators

$$\frac{3}{2+\sqrt{x}} \times \frac{2-\sqrt{x}}{2-\sqrt{x}} = \frac{6-3\sqrt{x}}{4-2\sqrt{2}+2\sqrt{x}-x} = \frac{6-3\sqrt{x}}{4-x}$$

Mixed Radicals

$$\sqrt{162} \longrightarrow \sqrt{9^2 \times 2} \longrightarrow \sqrt{9^2} \times \sqrt{2} \longrightarrow 9\sqrt{2}$$

Absolute Polynomial

$$|x - 1| = 3$$

$$x - 1 = 3, x = 4$$

$$x - 1 = -3, x = -2$$

Adding/Subtracting Fractions

Multiply both terms so that the denominators are the same, then add/subtract.

$$\begin{aligned} \frac{2}{x-1} - \frac{3}{x+3} \\ \longrightarrow \frac{2(x+3)}{(x-1)(x+3)} - \frac{3(x-1)}{(x-1)(x+3)} \\ \longrightarrow \frac{(2x+6)-(3x-3)}{(x-1)(x+3)} \\ = \frac{-x+3}{(x-1)(x+3)} \end{aligned}$$

Piecewise Functions

Piecewise functions are functions with multiple inequalities/restrictions that dictate which function to use at specific x values.

When graphing...

- if an inequality is less/greater than a value, the plot point is **not filled in**
- if an inequality is less/greater than **OR equal to** a value, the plot point is **filled in**
- if x of different functions equal the same value, the graphs are continuous, and are filled in if one of the functions is inclusive

If the inequalities do not state a function for a specific x value (e.g. $x = 2$ for $2 < x < 2$) then that value **DNE**. (**does not exist**)

Rational Function

A function with a polynomial in the numerator and denominator.

Vertical Asymptotes

Zeros of the denominator of a rational function.

x may approach these values, but never touch them.

Point of Discontinuity

Any vertical asymptote (zeros of denominator) **before simplifying** a rational function.

These vertical asymptotes only applies to the unsimplified form; this makes it a point of discontinuity.

Horizontal Asymptotes

Horizontal asymptotes describe the **trend** of a function.

The graph line can cross over it fine, as opposed to vertical asymptotes.

Determining Horizontal Asymptotes

- degree of numerator $<$ degree of denominator
→ $y = 0$
- degree of numerator $=$ degree of denominator
→ $y = \frac{\text{leading coefficient of numerator}}{\text{leading coefficient of denominator}}$
- degree of numerator $>$ degree of denominator
→ Divergent (no horizontal asymptote)

Limits

$$\lim_{x \rightarrow a} f(x) = b$$

The limit of $f(x)$ as x approaches a is b .
