Electric Fields

Micheal Faraday

- Developed the idea of "lines of force" to describe electric fields
- A field is a "sphere of influence" in which a force can affect an object at a distance without contact
- There are electric, gravitational, and magnetic fields
- The symbol for electric field is $|\vec{E}|$

Gravitational Fields

$$\vec{g} = 9.81 \frac{\text{m}}{\text{s}^2}$$

$$\vec{g} = \frac{Gm}{r^2}$$

- G = gravitational constant ($6.67 \cdot 10^{-11} \text{ N} \cdot \text{m}^2/\text{kg}^2$)
- m = mass of planet
- r = radius of the planet

Drawing Electric Field Lines

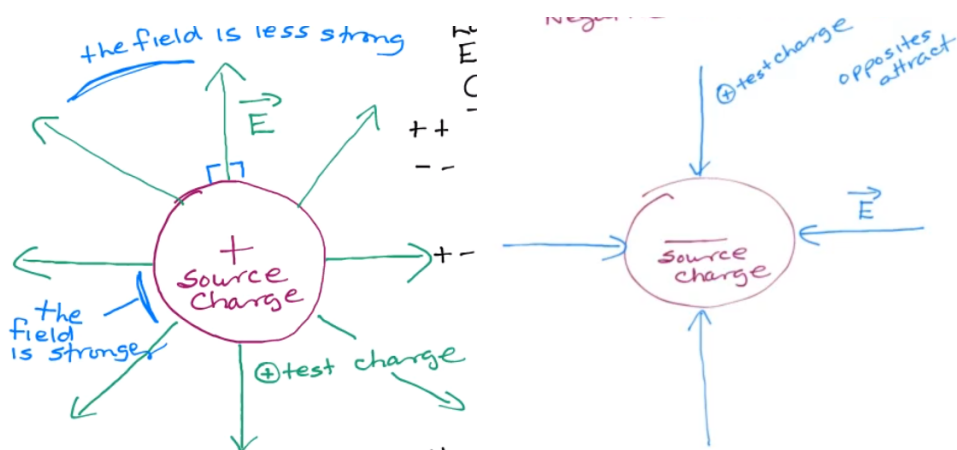

- Like charges repel, opposite charges attract
- The field is stronger the closer to the source charge it is
- We **always** use a **small positive test charge** to map/draw the electric field

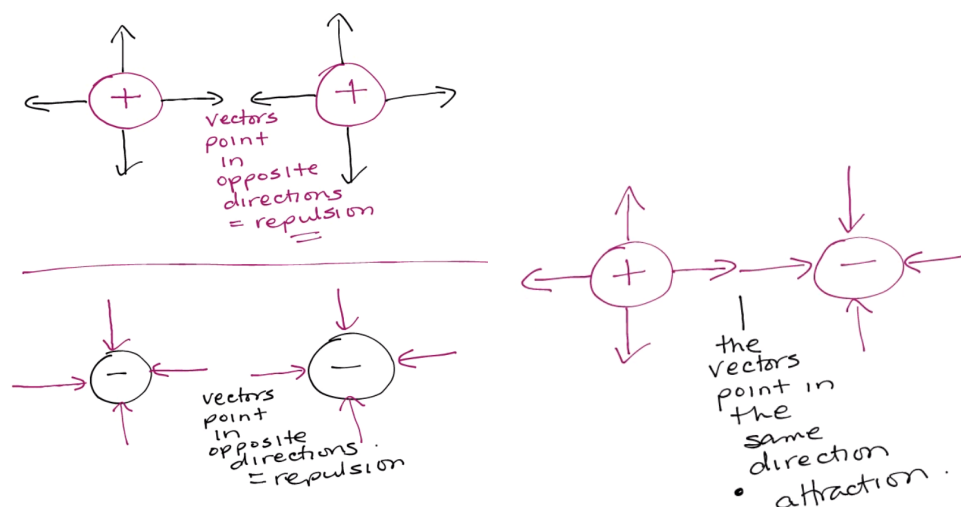

Rules

- The lines must originate on a positive charge and end on a negative charge (**positive to negative**)
- The electric field line must be **perpendicular to the surface** of the charge
- The **number of lines** drawn leaving a positive charge or approaching a negative charge is proportional to the **magnitude of the charge**
- **No two field lines can cross** each other

Electric Field Around A Positive v/s Negative Source Charge

Electric Field Interactions

Use this theory with a test particle to determine the direction of an electric field. NOT signs.

Particles

	charge	mass
Alpha particles	$+3.20 \times 10^{-19} \text{ C}$	$6.65 \times 10^{-27} \text{ kg}$
Electrons	$-1.60 \times 10^{-19} \text{ C}$	$9.11 \times 10^{-31} \text{ kg}$
Protons	$+1.60 \times 10^{-19} \text{ C}$	$1.67 \times 10^{-27} \text{ kg}$
Neutrons	0C	$1.67 \times 10^{-27} \text{ kg}$

Electric Field Strength

Electric Field Around A Producer (Source Charge)

$$|\vec{E}| = \frac{kq}{r^2}$$

$$\text{Units: } \frac{\text{N}}{\text{C}} \text{ or } \frac{\text{V}}{\text{m}}$$

- k = Coulomb's Constant ($8.99 \cdot 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2$)
- q = Value of the source charge (C)
- r = Distance from the source charge (m)

Electric Field Experienced By A Charge

$$\vec{E} = \frac{\vec{F}_e}{q}$$

- \vec{E} = Electric Field ($\frac{\text{N}}{\text{C}}$)
- \vec{F}_e = Electrostatic Force (N)
- q = Test Charge (in a field question, its not source charge) (C)

Example

Calculate the electric field 2.00 cm from an alpha particle.

$$|\vec{E}| = \frac{(8.99 \cdot 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(3.20 \cdot 10^{-19} \text{ C})}{(2.00 \cdot 10^{-2} \text{ m})^2}$$

$$|\vec{E}| = 7.19 \cdot 10^{-6} \frac{\text{N}}{\text{C}} \text{ radially outward}$$

Example II

Calculate the electric field strength at a point in space where a $3.24 \cdot 10^{-6} \text{ C}$ charge experiences an electrostatic force of $5.29 \cdot 10^{-3} \text{ N}$.

$$\vec{E} = \frac{\vec{F}_e}{q}$$

$$\vec{E} = \frac{5.29 \cdot 10^{-3} \text{ N}}{3.24 \cdot 10^{-6} \text{ C}}$$

$$\vec{E} = 1.63 \cdot 10^3 \frac{\text{N}}{\text{C}}$$

Example III

Calculate the electric field midway between the two charges below if they are 5.00 cm apart.

charge 1

$$|\vec{E}_1| = \frac{Kq}{r^2}$$

$$|\vec{E}_1| = \frac{8.99 \times 10^9 \text{ N} \cdot \text{m}^2}{\text{C}^2} \times \frac{2.40 \times 10^{-6} \text{ C}}{(2.50 \times 10^{-2} \text{ m})^2}$$

$$|\vec{E}_1| = 34\,521\,600 \frac{\text{N}}{\text{C}} \text{ WEST}$$

charge 2

$$|\vec{E}_2| = \frac{8.99 \times 10^9 \text{ N} \cdot \text{m}^2}{\text{C}^2} \times \frac{5.40 \times 10^{-6} \text{ C}}{(2.50 \times 10^{-2} \text{ m})^2}$$

$$|\vec{E}_2| = 77\,673\,600 \frac{\text{N}}{\text{C}} \text{ WEST}$$

$$|\vec{E}_{net}| = |\vec{E}_1| + |\vec{E}_2|$$

$$|\vec{E}_{net}| = 34\,521\,600 \frac{\text{N}}{\text{C}}, \text{ west} + 77\,673\,600 \frac{\text{N}}{\text{C}}, \text{ west}$$

$$|\vec{E}_{net}| = 1.12 \cdot 10^8 \frac{\text{N}}{\text{C}}, \text{ west}$$
